

Mission Impossible...?

- ISOTEST® solves the grounding problem where conventional grounding methods fail
- Use the advantages of capacitive grounding using ISOTEST® Holiday Detectors

The Challenge

1. You need a reliable holiday-testing device that can perform pore testing even if the field coating is already completely applied?
2. You cannot find accessible grounding connections, e.g. a bare pipe end, in your working area?

The Solution:

1. Capacitive grounding with the ISOTEST® grounding sleeve.
2. Capacitive grounding is the only method that works with completely coated pipes.
3. If no grounding points are accessible, capacitive grounding is the "way to go".

Your Advantage:

1. Reliable testing results regardless the availability of a bare pipe end for grounding.
2. For more detailed information visit our [tutorials](#) (section grounding)
3. Contact us again in the near future for further information on „how does that work?“

With kind regards
